

# **COVID-19 Patient Instructions After Testing**

# WHAT SHOULD I DO WHILE I WAIT FOR MY RESULT?

- Self-isolate to your home. If you live with others, self-isolate in a private room and use a private bathroom, if possible. Interact with others as little as possible.
- Wear a mask when you enter general living areas.
- Whoever else lives in your home should also stay at home.
- Make a list of close contacts from two days before you became sick until you self-isolated. Close contacts are those who have been within 6 feet of you.
- If you develop additional symptoms or if your symptoms get worse, notify your health care provider immediately for further instructions.

# WHAT SHOULD I DO IF I TEST POSITIVE?

- Notify your close contacts and let them know they should self-isolate at home for 14 days. This includes your family members and anyone who lives with you.
- Self-isolate in your home until each of the following conditions are met:
  - 1. It has been at least seven days since your symptoms first appeared AND
  - 2. It has been at least three days since you have not had a fever (without using feverreducing medications) and your respiratory symptoms are improving (e.g., cough, shortness of breath).
- Practice social distancing for seven days since you last had symptoms.
  - 1. While you do not have to remain in isolation, you may not return to work until seven days after your symptoms have resolved.
- Continue to self-monitor for symptoms for fourteen days since you last had symptoms.
- If your symptoms get worse or if you require hospitalization, notify your health care provider immediately and follow instructions about wearing a mask when you arrive to the facility.

### WHAT DO I DO IF MY TEST IS NEGATIVE?

- If your test is negative and you had **a known exposure** to a confirmed case, quarantine until 14 days after your exposure.
- If your test is negative and you had **no known exposure** to a confirmed case and you are **asymptomatic** (do not have symptoms), you can stop self-quarantine. Continue to practice social distancing.
- If your test is negative and you had **no known exposure** to a confirmed case, but you are **symptomatic**, you may have another respiratory pathogen that is circulating in the community. Avoid work and group settings until three days after you have not had a fever (without using fever-reducing medications) and your respiratory symptoms are improving.
